April 23, 1974

Dr. E. E. Grishayev Head, Department of Finance and Capital Investment State Committee of the Council of Ministers Moscow, U.S.S.R.

Dear Dr. Grishayev:

In accordance with our agreement reached at the November, 1973, meeting of the US-USSR Joint Group of Experts in the Field of Science Policy, I am enclosing for your consideration material called for in the Study Outline established for the exchange of information on the financing of research and development.

The material is organized into two sections. The first contains table shells showing the types of USSR research and development data requested by US analysts of Soviet research and development activities. The second contains table shells representing the types of research and development financial data which can be made available to Soviet experts on research and development activities in the US and related material on US collection methodologies, definitions and concepts.

Generally, the research and development expenditure data called for in both sections pertain to:

type of work (fundamental and applied research, development, construction of research and development plant)

type of research and development performer

field of science

Approved For Refease 2000/08/23: CIA-RDP79-00798A000500090003-10.)

branches of the national economy (industry, agriculture, etc.)

cost elements (wages, materials)

size of performing institution

geographic location

sources of financing (budget, enterprise funds) and mode of financing contracts, direct funding.

The terminology used to describe the characteristics of Soviet research and development financial data reflect US perceptions of the appropriate terms based on available Soviet literature. Our perceptions may be faulty, and it is possible that better terms can be arrived at in further discussions.

Section I contains 24 table shells for which Soviet data are requested. The first 21 of these tables refer to science outlays (on research and development and/or construction) as defined in Soviet statistical practice. Since Soviet accounting differs somewhat from ours, and since an ultimate goal of our joint effort is to develop more comparable measures of US and USSR research and development activity, we have included three additional tables (Tables 22-24) which deal with expenditures not included in Soviet data on science outlays but are included to a considerable extent in US data on research and development in industrial enterprises.

Throughout Tables 1-21, terminology is intended to be uniform. Thus, in Table 1 "research and development" means science outlays excluding construction, and this is the meaning in which research and development is used throughout the first 16 table shells. Similarly, in Table 1, "construction" means capital investment for science only, and this is its meaning in Tables 4 and 18-20. Where a term has a more restricted meaning in one table than in another, this is specified: for example, in the tables that involve distributions of outlays by type of performer, "production enterprises" conceptually includes enterprises in all branches of material production; in Tables 17 and 22-24, it seemed appropriate to restrict the term to industrial enterprises only.

Please note that Table 21 asks for a distribution of research and development outlays by function or purpose but that no functional categories are provided. This omission arises from the difficulty in framing such a table in terms that do not simply duplicate either the functional categories used by the US side, which may not be suitable for classifying Soviet research and development data, or terms used in the distribution asked for by branch of the economy and branch of industry. We will welcome indications of possible functional categories Approved For Release 2000/08/23: CIA-RDP79-00798A000500090003-1

Dr. E. E. Grishayev

April 23, 1974

for which the USSR side could provide data. The extent to which the distributions by branch of the economy and branch of industry approximate functional groupings depends of course on how the data are derived. We anticipate that many questions of this sort will arise throughout the study which will be clarified by providing explanatory notes with tabular material and by exchange of information on statistical concepts, definitions and methodology of collecting and aggregating data, as provided for in the Study Outline.

The years specified on the tables represent our notion of what data are most likely to be available in finished form in Soviet statistics. If, however, the Soviet side is able to provide data for nonspecified years, such data would be welcome.

Section II contains 38 table shells indicating the data the US side can make available to Soviet analysts on US financing of research and development. The tables provide for data aggregated to the national level as well as selected statistics for each of the four major sectors of the economy. We have included in Section II information on the definitions, concepts and survey methodology (including survey forms and instructions) used in collecting US data on research and development.

I look forward to receiving from you in the near future a list of the types of data Soviet analysts would be interested in receiving from the US side and the types of data on research and development financing available from the Soviet side.

Section II. U.S. R&D EXPENDITURE SURVEY CONCEPTS, DEFINITIONS AND METHODOLOGY

Performing Sector. U.S. Data on R&D financing are collected and compiled for each of the four major sectors of the national economy. The Federal Sector is made up of the departments and agencies of the Federal Government. The industry sector consists of both manufacturing and non-manufacturing companies. Manufacturing companies are classified in major industry groupings and non-manufacturing companies, which include organizations such as those in selected service industries, are treated as a unit. FFRDC's administered by industrial firms are also included. The universities and colleges sector is composed of all institutions of higher education, both public and private. The universities and colleges sector is comprised of the following:

colleges of liberal arts
schools of arts and sciences
professional schools, such as engineering and
medical schools (including affiliated hospitals)
associated research institutions and similar
organizations which represent an integral part
of a university or college
agricultural experiment stations and associated
schools of agriculture

Institutions in the nonprofit sector fall into two general groups:

1) organizations that are primarily granting in nature, namely private philanthropic foundations and voluntary health agencies and 2) public and private organizations that are involved in performing research and development including separately incorporated nonprofit research institutes, professional societies, academies of science, museums, zoological gardens, botanical gardens, arboretums, nonprofit hospitals.

Finally, within each of the private sectors are a number of Federally Funded Research and Development Centers administered by private organizations. These centers are R&D performing organizations exclusively or substantially financed by the Federal Government, that were established to meet either a particular R&D objective or to provide major facilities at universities for research and associated training purposes.

R&D Activity. Research and development consist of basic and applied research in the sciences (including medical sciences) and in engineering and activities in development, as defined below.

Research, which is made up of basic and applied, is systematic, intensive study directed toward fuller scientific knowledge of the subject studied. Research in the natural sciences - life, physical and engineering - as well as the social and psychological sciences is covered in the Federal, universities and other nonprofit sectors. Industry coverage is limited at present to the natural sciences.

Basic research for three of the sectors, the Federal Government, universities and colleges, and other nonprofit institutions, is defined to stress the emphasis on activity in which the primary aim of the investigator is a fuller knowledge or understanding of the subject under To take account of an industry's commercial goals, the definition of basic research for this sector is modified to cover original investigations for the advancement of scientific knowledge which do not have specific commercial objectives although they may be in fields of present and potential interest to the reporting company.

Applied research as defined for surveys of universities and colleges is research directed toward the practical application of knowledge. take account of the unique characteristics of industrial organizations, the industry survey defines applied research as research directed toward the discovery of new scientific knowledge which has specific commercial objectives with respect to either products or processes. By this definition, applied research in industry differs from basic research chiefly in terms of objectives of the reporting company.

Development may be summarized as the systematic use of scientific knowledge directed toward the production of useful materials, devices, systems or methods including design and development of prototypes and Development includes technical activities of a non-routine nature concerned with translating research findings or other scientific knowledge into products or processes. Development does not include routing technical services to customers.

Current operating costs for research and development refer to both direct and indirect costs of research and development including depreciation, insofar as this information is available to respondents. Included under this category are wages and salaries, materials and supplies consumed, property and other taxes, maintenance and repairs, depreciation and an appropriate share of overhead. Also included are the costs of planning and administering R&D programs.

Capital R&D expenditures are excluded from current operating costs by definition and this practice is followed in both the industry and "other nonprofit" sectors. Under the accounting practices of some Federal agencies, particularly the Department of Defense, detailed data on Federal R&D funds, which are available only in terms of obligations rather than expenditures, do not include an allowance for depreciation but do include some obligations for capital items.

20003 4

Fields of science used to classify R&D expenditure data reported by the various sectors are divided into broad field categories, most of them consisting of a number of detailed fields. The broad fields are life sciences, psychology, physical sciences, environmental sciences, mathematics, engineering, social sciences and "other sciences not elsewhere classified." Specific taxonomies for fields of science are further described in the sections that follow on individual sector surveys. These taxonomies differ only in the level of detail provided.

National R&D Expenditures

National statistics on R&D expenditures are compiled from survey data collected independently from all four sectors of the economy - Federal Government, industry, universities and colleges and other nonprofit organizations - based on the amounts each sector reports as spent for intramural research and development and the sources of such funds. While surveys have been conducted in the Federal Government and industry sectors every year since 1953, the same frequency has not been maintained for universities and colleges and other nonprofit institutions. National data for years in which data were not available for the latter two sectors are based on survey data on the performance of total research and development from the Federal and industry sectors and on estimates for the university and other nonprofit sectors.

Federal R&D Funding

R&D funding. Data are collected from Federal agencies in terms of expenditures and obligations. Expenditures represent the amounts for checks issued and cash payments made during a given period regardless of when the funds were appropriated. Obligations represent the amounts for orders placed, contracts awarded, services received, and similar transactions during a given period, regardless of when the funds are appropriated and when future payment of money is required. For those agencies operating on a cost type budget accrued expenditures and costs are reported instead of obligations. Accrued expenditures represent all costs accrued during the reporting period e cept those subject to reimbursement from other agencies. The information on expenditures represent net cash payments for research and development and R&D plant exclusive of any receipts of the agencies for those purposes.

Obligations and expenditures for work performed in foreign countries include funds directly available to Federal agencies and special foreign currencies separately appropriated.

Reporting Period. The reporting period for Federal R&D funding survey is the fiscal year which is the government accounting period beginning July 1 of one year and ending June 30 of the following calendar year. Thus, fiscal year 1973 began on July 1, 1972 and ended June 1973.

Funds for research and development are reported on a three-year basis comparable with data shown in the Budget of the United States Government. The data include amounts actually expended or obligated in the last completed year, amounts budgeted for the current year and amounts representing the planned budget for the next year. Data for the latter two periods are considered estimates since they do not represent completed transactions and are subject to further appropriation, apportionment or allocation decisions.

Federal Agency. An agency is an organization of the Federal Government whose principal executive officer reports to the President. The two exceptions are the Library of Congress and the Postal Service which are also included in the survey. The term "subdivision" refers to any major organizational unit of a reporting agency such as a bureau, division, office or service.

Performers. Performers are either intramural organizations accomplishing operational functions or extramural organizations or persons receiving support or providing services as a result of a contract or grant.

Intramural performers are the agencies of the Federal Government. Their work is carried on directly by their own personnel. Extramural performers are all organizations outside the Federal complex that perform with Federal funds under contract or grant. Only costs of actual extramural performers are reported. The cost of extramurally procurred "off the shelf" supplies and equipment required to support intramural research and development are reported as part of the cost of intramural performance.

In addition to data on domestic R&D activities that are reported by the other three sectors of the economy, Federal R&D funding data include foreign performers which are confined to foreign citizens, organizations or governments as well as international organizations, such as NATO, UNESCO and WHO, performing R&D abroad financed by the Federal Government. Excluded are payments to U.S. agencies, organizations or citizens performing research and development abroad for the Federal Government.

A final category of performers included in data on Federal Funds for R&D is described as all other miscellaneous performers not covered in the foregoing categories such as state and local governments, and private individuals.

R&D Plant. Federal R&D funding data include obligations and expenditures for R&D plant, that is, R&D facilities and fixed equipment such as reactors, wind tunnels and radio telescopes. These data include funds for the acquisition or construction of major repairs to or alterations in structures, works, equipment, facilities, or land for use in R&D activities at Federal or non-Federal installations. Excluded from the R&D plant category are expendable equipment and office furniture and equipment. Obligations for foreign R&D plant are limited to Federal funds for facilities located abroad and used in support of foreign research and development.

Industrial R&D Expenditures

Operating expenditures incurred by industrial organizations in the conduct of research and development in their own laboratories or other company owned or operated facilities include wages and salaries, materials and supplies consumed, property and other taxes, maintenance and repairs, depreciation and an appropriate share of overhead that excludes capital expenditures.

Federally financed research and development includes receipts for work done by the company on R&D contracts or subcontracts and R&D portions of procurement contracts and subcontracts.

Company financed research and development includes the cost of companysponsored research and development performed within the company. It does not include company-financed research and development contracted to outside organizations such as research institutes, universities and colleges or other nonprofit organizations.

Geographic data on an industrial research and development expenditures include only those operations located in the 50 States and the District of Columbia.

Industries and industry groups shown separately in statistical tables are classified according to the Standard Industrial Classification (SIC) Manual as follows:

Manufacturing industries:

Food and kindred products (20) Textiles and apparel (22,23) Lumber, wood products, and furniture (24,25)

Paper and allied products (26)

Chemical and allied products (28) Industrial chemicals (281-82) Drugs and medicines (283) Other chemicals (284-89)

Petroleum refining and extraction (29,13) 1/ Rubber products (30) Stone, clay, and glass products (32) Primary metals (33)

Ferrous metals and products (331-32,3391,3399) Nonferrous metals and products (333-36,3392)

Fabricated metal products (34) Machinery (35) . Electrical equipment and communication $(36,48)^{1/2}$ Radio and TV receiving equipment (365) Communication equipment and electronic components (366-67, 48) Other electrical equipment (361-64 and 369)

Motor vehicles and other transportation equipment 8(371.7 373-75, 379) Aircraft and missiles (372, 19)

Professional and scientific instruments (38) Scientific and mechanical measuring instruments (381-82)

Optical, surgical, photographic, and other instruments (383-87) Other manufacturing industries-tobacco manufacturers (21), printing and publishing (27), leather products (31), and miscellaneous manufacturing industries (39)

Nonmanufacturing industries:

agriculture, forestry, and fisheries (07-09); mining (10-12,14); contract construction (15-17); transportation and other public utilities (41-47,49); wholesale and retail trade (50-59); finance, insurance, and real estate (60-67); and selected service industries (739,807,891).

^{· 1/}Crude petroleum extraction (13) is grouped with petroleum refining (29), and communication (48) is grouped with electrical equipment (36), in the manufacturing group of industries.

A reporting unit for industry R&D expenditure data is the company or corporate family which includes all establishments under common ownership or control. Similarly each company is classified in a single size category on the basis of its total employment.

The industry R&D survey sample encompasses all manufacturing industries and those non-manufacturing industries known on the basis of earlier more detailed samples to conduct or to finance research and development. The sampling unit for the survey is the company, defined as a business organization consisting of one or more establishments under common ownership or control. All manufacturing companies with 1,000 or more employees in 1967, as determined from the 1967 Economic Censuses Enterprise Statistics multi-unit file, are included in the samples with certainty. Manufacturing companies with fewer than 1,000 employees are sampled at rates depending upon their industry and employment size as determined in the 1967 Economic Censuses Enterprise Statistics multi-unit file and the 1967 Census of Manufacturing universe file. For non-manufacturing industries, the sample was based on the 1966 records of the Social Security Administration.

Approximately 8,000 manufacturing and non-manufacturing companies were represented in the 1971 sample. More than 1,800 of the companies included were "certainty" companies which account for almost 95 percent of the total R&D performance funds. The probabilities of being selected in the industry survey range from one change in 200 (.005) to certainty (1.000).

Universities and Colleges R&D Expenditures

Current expenditures for separately budgeted R&D include direct and indirect costs for research and development performed under a grant or contract from the Federal Government, State Government, industrial organizations, etc., and R&D paid for from institutions own funds which were designated or budgeted by the institution for such use.

Non-separately budgeted R&D Expenditures include amounts reported in addition to separately budgeted R&D expenditures representing departmental research and other R&D activities for which universities and colleges do not maintain separate records. These amounts are estimated by institutions and include funds allocated to departmental research by the various academic departments as well as so e indirect costs associated with R&D performance.

The coverage of the survey of universities and colleges survey includes some 800 institutions of higher education in the United States and U.S. possessions which are known to have R&D programs in the sciences and engineering. These institutions are sent mail questionnaires after which intensive follow-up procedures are employed with the larger universities resulting in obtaining R&D expenditures data comprising about 95 percent of all R&D expenditures at universities and colleges. Totals reported for this sector include estimates for nonresponse made from information compiled from secondary sources.

Nonprofit R&D Expenditures

Current R&D Expenditures include direct and indirect costs for R&D performed with funds provided by other organizations or from institutions' own funds. .

The coverage of the survey of independent nonprofit research organizations includes some 500 to 600 facilities which are surveyed by mail. Follow-up for non-response is conducted by mail or, in the case of the largest intramural R&D performers, by telephone. The criteria for including a research institution in this sector is based primarily on its independent and tax exempt status with the U.S. Internal Revenue Service. There is no single directory or source document from which a complete mailing list of nonprofit organizations which perform research and development is available. Organization's are selected for surveying, therefore, from mailing lists used in previous surveys and a number of specialized directories. The number of such organizations with R&D expenditures totalling \$100,000 or more excluded from the survey is believing to be extremely small.

Functional Distribution of Federal R&D Obligations

Scope and coverage. Data on Federal R&D obligations by function, (or R&D objective) presents a distribution of Federal funding by 16 individual functions representing the major purposes for which **U.S.** R&D efforts are committed. This distribution is made by National Science Foundation staff based on data compiled for the Budget of the United States Government and on agency reports to the National Science Foundation on R&D obligations.

The data on Federal outlays by function and subfunction are taken directly from the budget document. Interest is excluded as a function as is general revenue sharing the annual totals used for computation of shared relationships represents total outlays minus interest general revenue sharing and special allowances plus undistributed adjustments. No information is available to permit distribution of offsetting receipts among the various subfunctions.

II-9.

Classifications and definitions. The definitions of functions and subfunctions are implicit in their titles and content. Each function under the budget arrangement embraces the agency's components whose primary mission is related to that function. R&D programs of each agency's subdivision or program are classified into a single function since multiple functions would cause programs to overlap and add to more than 100 percent of total R&D expenditures. 19

CENTER FOR POLICY ALTERNATIVES

MIT Building 39-547

CABLE ADDRESS: MIT CAM

TWO NUMBER: (710) 320-0058

CAMBRIDGE, MASSACHUSETTS 02139 (617) 253-1661

April 9, 1974

Dr. E. E. Grishayev Head, Department of Finance and Capital Investment State Committee of the Council of Ministers Moscow, U.S.S.R.

Dear Dr. Grishayev:

The United States members of the working subgroup on financial research and development statistics have been deeply involved over the past several weeks in identifying data on Soviet research and development expenditures which United States analysts feel will be needed for comparative studies on United States and U.S.S.R. levels of effort in research and development. Similarly, financial data on United States research and development for use by Soviet analysts have been selected for your consideration and relevant information on United States definitions concepts and survey methodologies is being prepared.

I expect the work on this phase of the study program to be completed in the very near future so that the material can yospe sent to you by the end of April. I am looking forward to receiving comparable material prepared by you and your associates.

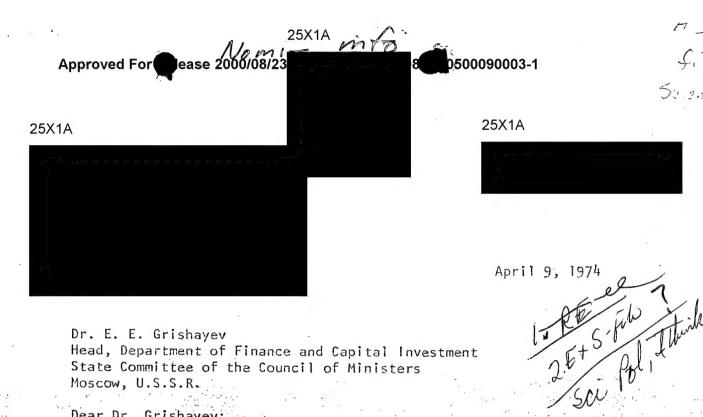

I am sorry you were unable to attend the November meeting held in Washington, D.C. It was a pleasure, however, meeting and working with Dr. Maslennikov. Please give him my warmest regards.

Sincerely,

Center for Policy Alternatives
